Ticket No: 664YD3

Covid-19 PCR

<u>Parameter</u>	<u>Result</u>	<u>Normal Range</u>
SARS-COV-2 RNA (Target 1)	Not-Detected	N/A
Methodology:		

The test for Novel Corona Virus (SARS-COV-2) has been performed using Real time RT-PCR, in which the target RNA in the specimen (Nasopharyngeal/Oropharyngeal swab, sputum or Bronchial lavage) is extracted and subjected to amplification and detection/quantification with high sensitivity reagents kits.

Comments:

- 1.The negative results must be interpreted in the light of clinical presentation, patient's history and epidemiological information. A single negative result does not completely exclude possibility of infection. Repeat test may be required in 24-48 hours, if clinically indicated. Such patients are advised to consider them as suspected cases and observe all necessary precautions until cleared by a 2nd Negative test
- 2.In case of positive test result, the patient is recommended to stay in isolation and observe other precautionary measures; take symptomatic treatment and should seek immediate medical advice in case of shortness of breath.
- 3.Other tests required for timely treatment decision in symptomatic cases, include Blood CP with absolute lymphocyte count, serum ferritin, LDH, CRP, D-Dimmer, CPK, Troponins, ALT, Creatinine and X-ray chest PA View.
- 4.Negative result in already known positive case will require confirmation after 24-48 hours with a fresh sample.
